

ALVBOV

Model: IMIL-ALVBOV

FEATURES

- Integrates the rebreather automatic loop volume valve (ALV) with a high performance open circuit regulator as a Bail out valve to enable switch over at the press of a button
- Interchangeable gas with zero face fittings
- The lowest work of breathing of any rebreather mouthpiece. Fitted with the ALVBOV, the Incursion Back mount has a work of breathing of 0.35 J/L – a third that of its nearest rival.
- Proven in field use for over a decade

BENEFITS

- Instant Bailout on demand

Shuts the mouthpiece automatically when the diver removes it from his mouth, protecting the rebreather from flooding

DESCRIPTION

The ALVBOV fully integrates the ALV function that maintains the loop volume in the rebreather – sometimes called an ADV, with a high performance bail out valve. The integration is perfect, with the single valve mechanism performing both functions.

The main valve mechanism uses genuine Apeks components, recognised as among the highest performance and most reliable second stage regulators in the industry. The bail out function is triggered by pressing a spring loaded button, causing instant bail out with no additional effort. The mouthpiece remains in the diver's mouth at all times.
